# THE STATE OF PRIVATE PENSIONS: CURRENT 5500 DATA

By Marric Buessing and Mauricio Soto\*

### Introduction

Every year, pension plan sponsors are required to file a return with the U.S. Department of Labor. These returns, known as the Form 5500 series, contain detailed information about the plans' finances, participants, and administrators that allows government agencies to monitor compliance with the Employee Retirement Income Security Act (ERISA) and the Internal Revenue Code. The comprehensive nature of the Form 5500 series makes them a primary source for examining the state of the private pension world: from participation rates to financial health to 401(k) investment in company stock to the size of employer contributions — it is all there.

Unfortunately, these rich data are not available in a timely manner.<sup>2</sup> The data from the "Private Pension Plan Bulletins Abstract of Form 5500 Annual Reports" — the official tabulations put out by the Department of Labor commonly used by practitioners and researchers — have a five-year lag. Sponsors have up to ten months to file the forms, and it can take up to two years to convert the raw forms, which generally are filed in paper, into a manageable and complete dataset. Then, these data must be cleaned, analyzed, and tabulated. The resulting lag meant that as of early 2006, official tabulations were available only up to 2000.<sup>3</sup>

This brief uses raw 5500 Form data from the Department of Labor to extend the tabulations to 2003 — the latest year in which the datasets are available. The estimations are done for the 1990-2003 period, and are presented as a data appendix to this brief. The 1990-2000 numbers match closely those from official reports; the 2001-2003 calculations bring the tabulations as up-to-date as currently possible. 5

Using these recent data, this brief highlights trends that are impossible to observe in the current official releases: a notable increase in pension contributions for defined benefit plans; the decline and recovery of pension assets in the 2001-2003 period; the continued use of cash balance plans; and the sustained move in coverage towards defined contribution plans.

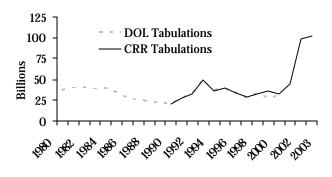

# Contributions to Defined Benefit Plans Tripled

During the late 1980s and 1990s, a combination of growing asset values and regulatory constraints allowed defined benefit plan sponsors to make little or no contributions to their pension funds. After 2000, the decline of the stock market and the rapid

\*Marric Buessing is a Research Associate at the Center for Retirement Research at Boston College. Mauricio Soto is a Senior Research Associate at the Center. Baris Yoruk provided research assistance in the initial stages of this project. The authors thank Daniel Beller, formerly with the Department of Labor (DOL), for important clarifications of the use and availability of the data. David McCarthy and Kevin Schutt (both with the Office of Policy and Research at the DOL) provided helpful guidance. The authors are also grateful to Anja Decressin (DOL) for pointing out clever ways to use these data in conjunction with other datasets, Vicky Kiosse for discovering duplicated observations in the latest available data, and Francis Vitagliano for explaining regulatory changes that affected the Form 5500 series since their inception. Although the staff of the DOL was extremely helpful in the development of this brief, the final analysis, accompanying data tables, and technical appendix are the sole responsibility of the authors and are in no way endorsed by the DOL.

drop of interest rates dubbed by analysts as "the perfect storm" brought an end to this contribution holiday. As assets in the pension funds plummeted and projected liabilities increased, funding rules required many plan sponsors to inject a significant amount of cash into their pension funds. Figure 1 shows the sudden increase in contributions after 2000, from an average annual contribution between 1980 and 2000 of about \$30 billion per year to \$45 billion in 2001, and to about \$100 billion in 2002 and 2003. The dramatic increase in contributions to defined benefit plans contrasts with the stable trends of the annual inflows to defined contribution plans (see Table E16 of the data appendix that accompanies this brief).

\*Note: Plans with 100 or more participants.

Sources: U.S. Department of Labor (2004) and (2005); and authors' calculations from raw universe 5500 data files.

# **Pension Assets Rebounded**

Figure 2 shows the extraordinary growth of pension assets in the last two decades. From 1980 to 2003, combined assets of defined benefit and defined contribution plans experienced an eight-fold increase to almost \$4 trillion. Compared to this growth, the fall of assets between 1999 and 2002 appears to be just a brief dip. By 2003, pension contributions and the recovery of the stock market drove the aggregate value of assets to a level comparable to that of 1999. The underlying data show that assets in defined contribution plans rebounded beyond 1999 levels, while defined benefit plans have yet to fully recover from the three year asset downturn (Table E13 of the data Appendix). These comprehensive tabulations show that 2002 was the first year in which the aggregate assets accumulated in defined contribution plans surpassed those from defined benefit plans.<sup>7</sup>

FIGURE 2. TOTAL PENSION PLAN ASSETS,\* 1980-2003

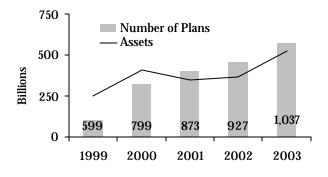

\*Note: Plans with 100 or more participants.

Sources: U.S. Department of Labor (2004); and authors' calculations from raw universe 5500 data files.

# **Cash Balance Plans Grew**

Since 1999, the Form 5500 has included a variable to identify cash balance plans. In that year, there were about 600 cash balance plans with 100 or more participants totaling more than \$250 billion in assets. Figure 3 points to the expansion of cash balance plans up to 2003, with the number of plans increasing to more than 1,000, and assets growing to about \$530 billion. Since 2003, cash balance plans have been the target of extensive litigation, which has brought their expansion to a virtual halt.

Figure 3. Plan Assets and Number of Cash Balance Plans, \* 1999-2003

\*Note: Plans with 100 or more participants.

Source: Authors' calculations from raw universe 5500 data files.

Issue in Brief

Large plans were the most likely to switch to cash balance plans. Table 1 shows that while in 2003 cash balance plans accounted for less than 10 percent of defined benefit plans, they held more than a quarter of the assets.

TABLE 1. PERCENT OF DEFINED BENEFIT PLANS, ASSETS, AND PARTICIPANTS IDENTIFIED AS CASH BALANCE

Year	Number of Plans	Assets	Participants
1999	4%	13%	10%
2000	6	23	16
2001	7	21	17
2002	8	23	20
2003	9	26	22

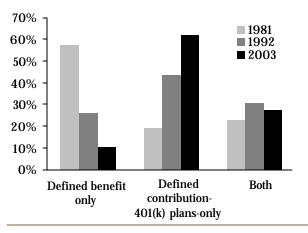

<sup>\*</sup>Note: Plans with 100 or more participants.

Source: Authors' calculations from raw universe 5500 data files.

# Shift to Defined Contribution Plans Continued

The prevalence of defined contribution plans in the private pension world is reflected in the most recent data. More than 60 percent of workers with pensions depend exclusively on a defined contribution plan, only about 10 percent are covered solely by a defined benefit plan, and the remaining 30 percent have dual coverage (see Figure 4).

FIGURE 4. PERCENT OF WAGE AND SALARY WORKERS WITH PENSION COVERAGE BY TYPE OF PLAN. 1981-2003

Sources: U.S. Department of Labor (2004) and authors' calculations from raw universe 5500 data files.

# Conclusion

The detailed nature of the 5500 data makes them a primary source of pension information. But the richness of these data also makes them complex. This complexity creates a significant lag between the data collection and the time in which aggregate numbers are available to the public.

Fortunately, the Department of Labor makes a raw version of the data available to researchers in a relatively short period — about two years — which allows for the estimation of recent trends and changes in the pension world that are outlined in this brief. Recent data show a rapid increase in pension contributions for defined benefit plans after 1999; the data also highlight the continuation of previous trends — i.e., a shift towards defined contribution plans, and the expansion of cash balance plans between 1999 and 2003.

Issue in Brief

## **Endnotes**

- 1 The main users of the 5500 series data are the Internal Revenue Service (IRS), which monitors compliance with the Internal Revenue Code; the Department of Labor (DOL), which examines compliance with ERISA; the Pension Benefits Guarantee Corporation (PBGC), which follows plan terminations and pension insurance premiums; and the Social Security Administration, which informs participants about the pension benefits they will receive. Other users include the Federal Reserve Board and the Bureau of Economic Analysis.
- 2 For more details on the lags created by the filing, processing and release of the data sets and tabulations, see U.S. Government Accountability Office (2005).
- 3 As of December 2005, the year 2000 tabulations by the DOL were still preliminary and incomplete.
- 4 The data used here correspond to the raw universe data files available from the Department of Labor. These raw files are publicly available from the Public Disclosure Room at 200 Constitution Avenue, NW, Room N-1513, Washington, DC 20210, or by calling (202) 693-8673.
- 5 Tabulations are done for plans with 100 or more participants. The calculations used to produce these tabulations follow closely the Department of Labor's assumptions and methodology used to generate the official reports. A technical appendix released in conjunction with this brief contains the details of the estimations.
- 6 See Munnell and Soto (2004) for details on the circumstances that created a contribution holiday for defined benefit plans. They predict increases in contributions similar to the ones observed for the 2001-2003 period.
- 7 For all plan assets, including those with fewer than 100 participants, defined contribution assets surpassed defined benefit assets in 1992.
- 8 Cash balance arrangements are defined benefit plans where the employer prefunds contributions, selects the investments, and bears the risk. To the employee, however, a cash balance plan looks very much like a defined contribution plan. According to the form instructions, the indicator included in the 5500 Form may also account for "similar plans" in which at least part of the benefit is defined in terms "more common to a defined contribution plan."

- 9 Cash balance plan assets may include those used to fund benefits for grandfathered participants under the traditional benefit formula.
- 10 The most notable case was Cooper vs. IBM Pension Plan. The ruling in this case issued July 31, 2003 deemed IBM's cash balance plan illegal under the anti-discrimination requirements of ERISA.

#### **About the Center**

The Center for Retirement Research at Boston College was established in 1998 through a grant from the Social Security Administration. The Center's mission is to produce first-class research and forge a strong link between the academic community and decisionmakers in the public and private sectors around an issue of critical importance to the nation's future. To achieve this mission, the Center sponsors a wide variety of research projects, transmits new findings to a broad audience, trains new scholars, and broadens access to valuable data sources. Since its inception, the Center has established a reputation as an authoritative source of information on all major aspects of the retirement income debate.
